

## Graphing Trigonometric Functions continued...

$y = \sin x$

$y = \cos x$

$y = \csc x = \frac{1}{\sin x}$

no zeros; asymptotes when  $\sin x = 0$

$y = \sec x = \frac{1}{\cos x}$

no zeros; asymptotes when  $\cos x = 0$

$y = \cot x = \frac{\cos x}{\sin x}$

zeros when  $\cos x = 0$ ; asymptotes when  $\sin x = 0$

$y = \tan x = \frac{\sin x}{\cos x}$

zeros when  $\sin x = 0$ ; asymptotes when  $\cos x = 0$

$y = af(x)$

For  $y = \sin x$  and  $y = \cos x$ ,  $|a|$  is the amplitude of the function. If  $a < 0$ , flip the graph vertically.

Ex.  $y = 2 \sin x$

$y = -\frac{1}{3} \cos x$

For  $y = \sec x$ ,  $y = \csc x$ ,  $y = \tan x$ , and  $y = \cot x$ ,  $|a|$  is the "amplitude" of reference points of the function. For  $\sec x$  and  $\csc x$ , these are the maximum and minimum points, and for  $\tan x$  and  $\cot x$ , these are the points halfway in between the zeros and vertical asymptotes.

Ex.  $y = -3 \sec x$

$y = 2 \tan x$

Ex.  $y = 4 \csc x$

$y = -\frac{1}{2} \cot x$

$y = f(bx)$

amp:  $|a|$  in  $y = af(x)$

The period of  $y = \sin x$ ,  $y = \cos x$ ,  $y = \sec x$ , and  $y = \csc x$  is  $2\pi$ . The period of  $y = \tan x$  and  $y = \cot x$  is  $\pi$ . This is how often the graph repeats itself. When  $x$  is multiplied by a constant, the period changes.

$$\text{new period} = \frac{\text{period of original function } (\pi \text{ or } 2\pi)}{|b|}$$

$y = \sin \frac{1}{2}x$

per:  $\frac{2\pi}{\frac{1}{2}} = \frac{2\pi}{1} \cdot \frac{2}{1} = 4\pi$

$y = \tan \frac{\pi}{8}x$

per:  $\frac{\pi}{\frac{\pi}{8}} = \frac{\pi}{1} \cdot \frac{8}{\pi} = 8$

$y = \sec \frac{259}{\pi^2}x$

per:  $\frac{2\pi}{\frac{259}{\pi^2}} = 2\pi \cdot \frac{\pi^2}{259} = \frac{2\pi^3}{259}$

$y = \cos 5x$

amp: 1  
per:  $\frac{2\pi}{5}$

$y = \tan \frac{1}{3}x$

"amp" = 1  
per:  $\frac{\pi}{\frac{1}{3}} = \frac{\pi \cdot 3}{1} = 3\pi$

$y = 3 \csc \pi x$

"amp": 3  
per:  $\frac{2\pi}{\pi} = 2$

$y = \frac{2}{3} \cot \frac{3\pi}{2}x$

"amp" 2/3  
per:  $\frac{\pi}{\frac{3\pi}{2}} = \frac{\pi \cdot 2}{3\pi} = \frac{2}{3}$

$$y = \pi \sin \frac{\pi}{2} x$$

amp:  $\pi$

per:  $\frac{2\pi}{\frac{\pi}{2}} = 2\pi \cdot \frac{2}{\pi} = 4$

$$y = -\sqrt{13} \csc \frac{4\pi}{22} x$$

amp:  $\sqrt{13}$

per:  $\frac{2\pi}{\frac{4\pi}{22}} = \frac{1}{22}$

\* amplitude is always positive

$y = a f(bx)$   
mult  $\Rightarrow$  stretching

$y = f(x + c) + d$

add  $\Rightarrow$  shifting

d = vertical shift

if  $d > 0$  up

$d < 0$  down

c = horizontal shift

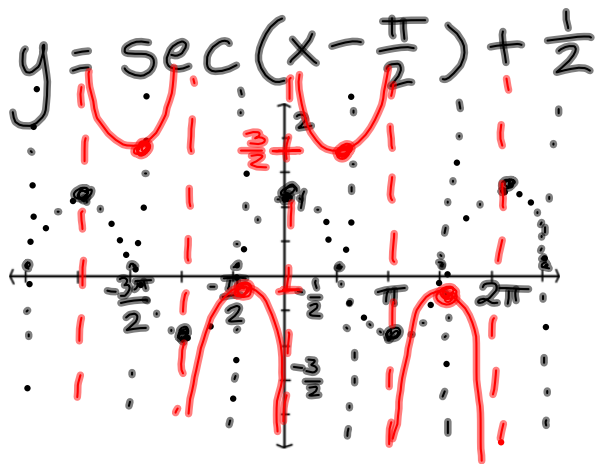

$c > 0$  left

$c < 0$  right

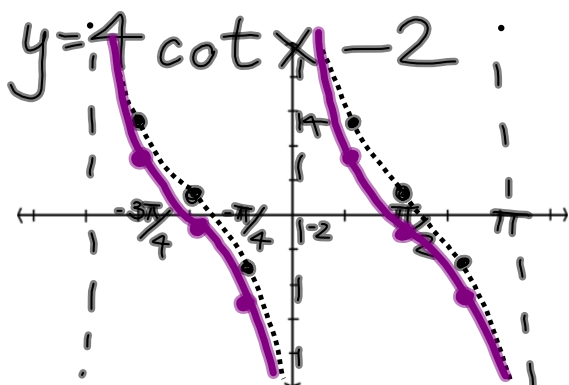

$y = x^2$  v.  $y = (x+1)^2$

coeff's outside  $\Rightarrow$   
vertical  
as you would expect;

inside  $\Rightarrow$   
horizontal,  
opposite of  
what you  
would expect

"amp": 1  
 per:  $2\pi$   
 horizontal shift: right  $\frac{\pi}{2}$   
 vertical shift: up  $\frac{1}{2}$

"amp": 4  
 per:  $\pi$   
 h. shift: none  
 v. shift: down 2

$$y = -3 \cos \frac{\pi}{3} x + \frac{3}{2}$$

amp: 3  
 per:  $\frac{2\pi}{\pi/3} = \frac{2\pi \cdot 3}{\pi} = 6$   
 h. shift: none  
 v. shift: up  $3/2$

$$y = -\frac{1}{7} \tan \left( x - \frac{3\pi}{4} \right) - \frac{2}{7}$$

"amp":  $1/7$   
 per:  $\pi$   
 h. shift: right  $\frac{3\pi}{4}$   
 v. shift: down  $2/7$

HW : #19-52

(at a minimum, do  
through #36 for  
tomorrow)
