Quiz #6

Name: _____
12 April 2013

Given the rational function

$$f(x) = \frac{x(x-4)(x+2)}{(x-2)(x+5)(x-6)} = \frac{x^3 \dots}{x^3 \dots}$$

- Determine the zeros of the function.
 $0, 4, -2$
- Determine the y-intercept of the function.
 $(0, 0)$
- Determine the equations of any vertical asymptotes of the function.
 $x=2, x=-5, x=6$
- Determine the equations of any horizontal or oblique asymptotes of the function.
 $\frac{x^3}{x^3} = 1 \quad y=1$
- Graph the function.

1. Given the polynomial $f(x) = 2x^3 + x^2 + 18x + 9$,

a. (5 points) What does **Descartes' Rule of Signs** tell us about the number of positive real zeros and number of negative real zeros?

positive: $f(x)$ has no sign change \Rightarrow 0 positive real zeros

negative: $f(-x) = 2(-x)^3 + (-x)^2 + 18(-x) + 9$
 $= -2x^3 + x^2 - 18x + 9$

3 sign Δ 's \Rightarrow 3 or 1 negative real zeros

b. (3 points) List all **possible** rational zeros of the polynomial.

factors of constant term = $\pm 9, \pm 3, \pm 1$
factors of leading coeff. = $\pm 2, \pm 1$
 $= \pm \frac{9}{2}, \pm 9, \pm \frac{3}{2}, \pm 3, \pm \frac{1}{2}, \pm 1$

c. (5 points) Given that $-\frac{1}{2}$ is a zero of the polynomial, use synthetic division to **find all other zeros**.

$$\begin{array}{r|rrrr} -\frac{1}{2} & 2 & 1 & 18 & 9 \\ & & -1 & 0 & -9 \\ \hline & 2 & 0 & 18 & 0 \end{array}$$

$$f(x) = (x + \frac{1}{2})(2x^2 + 18)$$

$$2x^2 + 18 = 0$$

$$2x^2 = -18$$

$$x^2 = -9$$
 $x = \pm 3i$

d. (2 points) Write the polynomial as a product of linear factors.

$$f(x) = (x + \frac{1}{2})(x + 3i)(x - 3i)$$

2. Given the polynomial $f(x) = -\frac{1}{3}(x + \frac{3}{2})^2(x - 1)^3(x - 2)^4$,

a. (5 points) Find the real zeros and state the multiplicity of each.

zeros: $-\frac{3}{2}$ 1 2
 mult: $\frac{2}{\text{even}}$ $\frac{3}{\text{odd}}$ $\frac{4}{\text{even}}$

b. (5 points) State the lead term and make a sketch depicting the end behavior of the graph.

$-\frac{1}{3}x^2 \cdot x^3 \cdot x^4 = -\frac{1}{3}x^9$

c. (3 points) State the y-intercept as an ordered pair.

$-\frac{1}{3}(\frac{3}{2})^2(-1)^3(-2)^4 = \frac{1}{3} \cdot \frac{3^2}{2^2} \cdot +1 \cdot \frac{2^4}{1} = 3 \cdot 2^2 = 12$
 $(0, 12)$

d. (6 points) Graph the polynomial. Label x- and y-intercepts.

3. (8 points) Find the equation of a polynomial of lowest degree with $4, \sqrt{2}$, and $3 - 2i$ as three of its zeros. Leave your answer in factored form.

$(x - 4)(x - \sqrt{2})(x + \sqrt{2})(x - (3 - 2i))(x - (3 + 2i)) = f(x)$

4. (8 points) Use the intermediate value theorem to determine if the function $f(x) = 4x^3 - 3x + 3$ has a zero between -2 and -1 .

If $f(a) > 0$ & $f(b) < 0$ (or vice-versa),
 there is some $c \in (a, b)$ such that $f(c) = 0$.

$f(-2) = 4(-8) - 3(-2) + 3 = -32 + 6 + 3 < 0$

$f(-1) = 4(-1) - 3(-1) + 3 = -4 + 3 + 3 > 0$

\Rightarrow IVT guarantees a zero between -2 & -1 .

5. (8 points) Solve the polynomial inequality. Give your answer in interval notation.

$4x^2 - 3x - 7 > 0$ $4x^2 > 3x + 7$

$4x^2 + 4x - 7x - 7 > 0$

$4x(x+1) - 7(x+1) > 0$

$(x+1)(4x-7) > 0$

zeros: -1 & $7/4$

$(-\infty, -1) \cup (\frac{7}{4}, \infty)$

6. Given the rational function

$$f(x) = \frac{x^2(x+6) - 4(x+6)}{x^2 + 6x^2 - 4x - 24} = \frac{x^2(x+6) - 4(x+6)}{x^2 + 2x - 3}$$

a. (3 points) Factor the function completely.

$$\frac{(x^2-4)(x+6)}{(x+3)(x-1)} = \frac{(x-2)(x+2)(x+6)}{(x+3)(x-1)}$$

b. (5 points) State the real zeros and the multiplicity of each.

$-2, 2, -6$ - all mult 1

c. (2 points) State the y-intercept as an ordered pair.

$\frac{24}{3} = 8$ (0, 8)

d. (4 points) Find the equation of any vertical asymptotes of the function.

$x = -3 ; x = 1$

e. (5 points) Find the equation of any horizontal or oblique asymptotes.

$\frac{x^3}{x^2} = x$ $y = x$

f. (5 points) Graph the rational function. Label all x- and y-intercepts and any asymptotes.

7. (8 points) Solve the rational inequality. Give your answer in interval notation.

$$\frac{x-4}{x+2} - 3 \geq 0$$

$$\frac{x-4}{x+2} \geq 3$$

$$[-5, -2)$$

$$\frac{x-4-3(x+2)}{x+2} \geq 0$$

$$\frac{-2x-10}{x+2} \geq 0$$

$$\frac{x-4-3x-6}{x+2} \geq 0$$

$$\frac{-2(x+5)}{x+2} \geq 0$$

8. (10 points) Find an equation of variation where y varies jointly as the square of x and the square of z and inversely as w, and y = 50 when x = 2, z = 5, and w = 10.

$$y = \frac{k x^2 z^2}{w}$$

$$k = 50 \cdot \frac{10}{2^2 \cdot 5^2} = 5$$

$$50 = \frac{k (2)^2 (5)^2}{10}$$

$$y = \frac{5 x^2 z^2}{w}$$
